Question 1
Correct
Flag question

You are transporting some boxes through a tunnel, where each box is a parallelepiped, and is characterized by its length, width and height.

The height of the tunnel 41 feet and the width can be assumed to be infinite. A box can be carried through the tunnel only if its height is strictly less than the tunnel's height. Find the volume of each box that can be successfully transported to the other end of the tunnel. Note: Boxes cannot be rotated.

Input Format

The first line contains a single integer **n**, denoting the number of boxes.

n lines follow with three integers on each separated by single spaces - *length, width*, and *height*, which are length, width and height in feet of the *i*-th box.

Constraints

1 ≤ n ≤ 100

1 ≤ length, width, height, ≤ 100

Output Format

For every box from the input which has a height lesser than 41 feet, print its volume in a separate line.

Sample Input 0

4

555

1240

10541

7 2 42

Sample Output 0

125

80

Explanation 0

The first box is really low, only 5 feet tall, so it can pass through the tunnel and its volume is $5 \times 5 \times 5 = 125$.

The second box is sufficiently low, its volume is $1 \times 2 \times 4 = 80$.

The third box is exactly 41 feet tall, so it cannot pass. The same can be said about the fourth box.

For every box from the input which has a height lesser than 41 feet, print its volume in a separate line.

Sample Input 0

4

555

1 2 40

10541

7 2 42

Sample Output 0

125

80

Explanation 0

The first box is really low, only 5 feet tall, so it can pass through the tunnel and its volume is $5 \times 5 \times 5 = 125$.

The second box is sufficiently low, its volume is $1 \times 2 \times 4 = 80$.

The third box is exactly 41 feet tall, so it cannot pass. The same can be said about the fourth box.

Answer: (penalty regime: 0 %)

```
1 |#include<stdio.h>
2 - struct Box{
        int length;
3
        int width;
4
5
        int height;
   };
6
7
   int main()
8 + {
        int n;
9
10
        scanf("%d",&n);
        struct Box boxes[n];
11
        for(int i=0;i<n;i++)
12
13 +
            scanf("%d %d %d",&boxes[i].length
14
15
            if(boxes[i].height<41)
            {
16 .
                printf("%d\n",boxes[i].length
17
18
19
20
        return 0;
21
   }
```

50 M 100 M 1	ut Expected Got
4 125 125 ✓ 5 5 5 80 80 1 2 40 10 5 41 7 2 42	5 5 80 80 2 40 5 41

Question 2 Correct

P Flag question

You are given n triangles, specifically, their sides a_k b_l and c_k Print them in the same style but sorted by their areas from the smallest one to the largest one. It is guaranteed that all the areas are different.

The best way to calculate a volume of the triangle with sides **a**, **b** and **c** is Heron's formula:

$$S = \ddot{O}p * (p - a) * (p - b) * (p - c)$$
 where $p = (a + b + c) / 2$.

Input Format

First line of each test file contains a single integer n. n lines follow with a_l b_l and c_l on each separated by single spaces.

Constraints

```
1 \le n \le 100

1 \le a_i, b_i, c_i \le 70

a_i + b_i > c_i, a_i + c_i > b_i, and b_i + c_i > a_i
```

Output Format

Print exactly n lines. On each line print 3 integers separated by single spaces, which are a_i b_i and c_i of the corresponding triangle.

Sample Input 0

3

7 24 25

5 12 13

345

Sample Output 0

3 4 5

5 12 13

7 24 25

Explanation 0

The square of the first triangle is 84. The square of the second triangle is 30. The square of the third triangle is 6. So the sorted order is the reverse one.

Answer: (penalty regime: 0 %)

```
#include<stdio.h>
    #include<math.h>
3
   struct Triangle
4 . {
5
        int a,b,c;
6
        double area;
7
   |};
8
   int main()
9 .
10
11
        scanf("%d",&n);
12
        struct Triangle triangles[n]:
```

Print exactly n lines. On each line print 3 integers separated by single spaces, which are a_i b_i and c_i of the corresponding triangle.

Sample Input 0

3

7 24 25

5 12 13

345

Sample Output 0

345

5 12 13

7 24 25

Explanation 0

The square of the first triangle is *84*. The square of the second triangle is *30*. The square of the third triangle is *6*. So the sorted order is the reverse one.

Answer: (penalty regime: 0 %)

```
#include<stdio.h>
    #include<math.h>
struct Triangle
 2
 3
 4 .
 5
        int a,b,c;
 6
        double area;
 7
 8
    int main()
 9
10
        int n;
11
        scanf("%d",&n);
        struct Triangle triangles[n];
12
13
        for(int i=0;i<n;i++)
14
15
            scanf("%d %d %d",&triangles[i].a,8
16
            double p=(triangles[i].a+triangles
17
            triangles[i].area=sqrt(p*(p-triang
18
19
        for(int i=0;i<n-1;i++){
20
            for(int j=i+1;j<n;j++){
21
                 if(triangles[i].area>triangles
22
23
                     struct Triangle temp=trian
24
                     triangles[i]=triangles[j];
25
                     triangles[j]=temp;
26
27
28
29
        for(int i=0;i<n;i++)
30 •
            printf("%d %d %d\n",triangles[i].a
31
32
33
        return 0;
34
```

	Input	Expected	Got
